

Subspace.money Product Teardown

Product Intern Assignment

Prepared by: Pathan Nazreen

Date: 29-05-2026

Company Chosen: **Subspace.money**

Product teardown based on hands-on exploration of the web platform.

Feedback 1 – GTM & ICPs

Figure 1: Homepage displaying subscriptions, rewards, vouchers, and multiple service categories.

Figure 2: Dashboard showing bill payments, subscriptions, events, and vendor-related options.

Observed

During my first interaction with Subspace, I noticed that the platform offers a wide range of services including subscription sharing, bill payments, rewards, events, and vendor products. These options are presented quite early in the user journey, both on the homepage and the dashboard.

Problem

While the variety of services is a strength, it was not immediately clear who the primary target user is. A student looking for affordable OTT subscriptions, a user wanting to manage recurring payments, and someone interested in vouchers may all have different goals. Since everyone sees a similar experience initially, users may need extra time to understand what Subspace is most useful for.

Ship Instead

I would introduce a simple onboarding step that asks users what they are primarily looking for when joining the platform.

For example:

- Save money through subscription sharing
- Manage recurring payments
- Purchase vouchers and deals
- Pay utility bills

Based on the selected goal, Subspace can personalize the homepage and highlight the most relevant features first. This would make the platform easier to understand and help users reach value faster.

Feedback 2 – Competitor Analysis

Figure 3: Subspace homepage displaying subscriptions, vouchers, rewards, bill payments, and other services.

Figure 4: Splitwise homepage clearly focused on expense sharing as its primary use case.

Observed

While comparing Subspace with Splitwise, I noticed a clear difference in how both products communicate their value. Splitwise immediately tells users what it does and who it is for. The homepage is focused on a single problem: helping people split expenses and settle balances.

In contrast, Subspace presents multiple services such as subscription sharing, vouchers, bill payments, rewards, and marketplace offerings from the beginning.

Problem

Subspace has a broader product offering, which is valuable in the long run. However, for first-time users, the number of options can make it harder to understand the platform's primary value proposition.

A user landing on the homepage may need additional time to decide where to start, whereas Splitwise guides users toward one clear action immediately.

Ship Instead

I would keep the full range of services but simplify the first-time experience.

Instead of presenting every category equally, Subspace could highlight one primary action based on user intent and gradually introduce additional features as users become familiar with the platform.

This would help reduce cognitive load while still allowing users to discover the wider ecosystem over time.

Feedback 3 – Features / Services

Figure 5: Subscription-sharing marketplace displaying available groups, host ratings, pricing, and member slots.

Figure 6: Chat interface allowing users to communicate with hosts before joining a subscription group.

Observed

One of the most interesting features in Subspace is the subscription-sharing marketplace. Users can browse available groups, compare pricing, view ratings, and even chat directly with hosts before joining.

This creates a more transparent experience compared to simply purchasing a subscription without any interaction.

Problem

While exploring the marketplace, I noticed that ratings are one of the main trust signals available to users. However, ratings alone may not provide enough context when deciding whether to join a group.

For example, two hosts could both have a 5-star rating, but one host may have completed hundreds of successful transactions while another may have completed only a few. From a user's perspective, it is difficult to judge reliability before making a payment.

Ship Instead

I would strengthen the trust layer by displaying additional host information such as:

- Number of successful transactions
- Active group members
- Average response time
- Verified Host badge
- Reliability score based on transaction history

These indicators would help users make more informed decisions and increase confidence when joining subscription groups.

Feedback 4 – UX

Figure 7: Checkout screen displaying subscription details, host information, pricing, and membership details.

Figure 8: Billing details screen showing the final payable amount before joining the subscription group.

Observed

The checkout experience is simple and easy to follow. Important information such as subscription name, host details, pricing, renewal date, and payable amount is clearly displayed before payment.

As a user, I was able to understand what I was purchasing without much effort.

Problem

Although the pricing information is clearly presented, I still had a few questions before making the payment.

For example:

- What happens if I lose access to the subscription?
- What if the host becomes inactive?
- How are disputes handled?
- Am I eligible for a refund if something goes wrong?

These concerns become more important at the payment stage because users are deciding whether they trust the platform enough to complete the purchase.

Ship Instead

I would add a small "Buyer Protection" section directly above the payment button.

This section could briefly explain:

- Refund eligibility
- Dispute resolution process
- Support availability
- Access protection policy

Providing these reassurances at the final decision stage can increase user confidence and reduce hesitation before completing the purchase.

Feedback 5 – Potential Collaborations

Figure 9: Food and brand marketplace featuring multiple categories and partner services.

Figure 10: Zomato voucher offerings available through the platform.

Figure 11: FlexiPay product page within the marketplace ecosystem.

Observed

While purchasing subscriptions, I did not see any recommendations connecting subscriptions with vouchers, food deals, or other products already available on the platform.

Problem

Users complete one transaction and leave without discovering other categories, reducing cross-category engagement.

Ship Instead

Add contextual recommendations after purchase:

- Bought Netflix → suggest Spotify sharing
- Bought Zomato voucher → suggest Swiggy voucher
- Bought Canva → suggest ChatGPT

Prioritization Section

Priority	Recommendation	Impact	Reason
P1	Strengthen Trust Layer in Group Sharing	High	Trust directly affects whether users are willing to join subscription groups and make payments.
P2	Improve Checkout Confidence	High	Addressing concerns around refunds, disputes, and access protection can reduce drop-offs before purchase.
P3	Personalize Onboarding & User Segmentation	Medium	Understanding user intent early can help users discover the most relevant features faster.
P4	Simplify Product Positioning	Medium	A clearer value proposition can improve first-time user understanding and activation.
P5	Introduce Bundled Partnerships	Medium	Bundles can increase cross-category engagement and encourage repeat usage across the platform.

Conclusion

Subspace.money offers a wide range of services, including subscription sharing, vouchers, payments, and digital products. During my exploration, I found opportunities to improve trust in the group-sharing feature, make onboarding clearer for new users, and help users discover more services available on the platform. I also believe that introducing bundled partnerships can increase user engagement and encourage repeat usage. Overall, the platform has strong potential and a solid foundation for growth.
